

DATA PROCESSOR CONTROLLED DISPLAY INTERFACE WITH
MULTIPLE TREE OF ELEMENTS VIEWS EXPANDABLE
INTO INDIVIDUAL DETAIL VIEWS

Abstract

5 A data processing controlled display system for the
interactive display and control of a hierarchical trees
of elements or objects in which multiple tree views are
presented to the user. The objects in the views are
selectable to display detail views of the objects,
10 particularly attributes of the child objects of the
selected parent object. The multiple tree views may be
of different portions of the same tree or of different
trees. The tree views are thus available for side by
side comparison and detailed study, after which the
15 system provides the capability to transfer objects from
tree view to tree view, e.g. by drag and drop means.
